

## Are you responsible for environmental education or community outreach on environmental and green issues?

Interactive EnviroScape® models dramatically demonstrate sources of pollution — and its prevention. Engaging and effective in creating a real sense of understanding through hands-on demonstrations, the EnviroScape® models cross cultural, language, learning and age levels to make seemingly complex issues clear. The models have been proven successful with students from K-12, universities, soil and water conservation districts, city governments, utility companies, corporate outreach specialists, consultants, and civic and environmental groups around the world.

### EnviroScape® Watershed/Nonpoint Source

**What happens when it rains?** This popular model demonstrates pollution and storm water runoff and its prevention in your watershed, focusing on residential, industrial, forestry, transportation, recreation, agricultural, and construction environments. The model shows how rain carries soil (represented by cocoa), chemicals (drink mixes) and oil (cocoa mixture) through the watershed to a pond, lake, river, bay, or ocean. The model can also be used to demonstrate best management practices to prevent pollution.

### EnviroScape® Wetlands

**What does a wetland do?** This model demonstrates the basic functions and values of inland and coastal wetlands. It is especially useful in teaching how to recognize different types of wetlands, understand what activities negatively affect wetlands, and illustrate what activities can help to conserve and protect wetlands.

### EnviroScape® Drinking Water & Wastewater Treatment

**Is our drinking water safe?** This model includes three demonstrations that can be done together or individually: drinking water sources and treatment, wastewater treatment, and biosolids. It also includes a bonus demo on storm water. The demonstrations allow you to follow the path of water used in our communities – residential, commercial, rural, and urban – from source, to use, to treatment, then back into the river. The model includes a septic system, rural water sources, and storm water discharged directly to a waterbody or sent to the wastewater treatment plant.

## ▶ EnviroScape® includes everything you need for a demonstration — except the water!

- The three-dimensional landscape models are approximately 25" x 30" x 5" and come with ingredients and props.
- A peer-reviewed, easy-to-use User's Guide is included to aid instructors, group leaders, or facilitators in presenting a demonstration.
- Optional setup videos and supplemental curriculum are also available.

## EnviroScape® Coastal

**Why are our beaches becoming polluted?** This model dramatically shows the sources of pollution and effects on wetlands, estuaries, oceans, beaches, barrier islands, groundwater, and coral reefs and shellfish beds. The demonstration dramatically relates to many different areas in a community such as residential, resorts and recreation, agricultural, urban areas, construction, marinas, beaches, and more. The model also includes marine debris, oil spills, industrial and treatment plants, underground storage tanks, storm water, and septic systems.

## EnviroScape® Hazardous Materials

**Toxic materials? Hazardous Wastes?** While these may sound too far removed from us, our communities are affected by them everyday. This model shows what is meant by toxic waste and hazardous materials, and demonstrates the best way to manage them in order to protect our health and environment. Demonstrations include transportation accidents, commercial facilities, underground storage tanks, abandoned sites, and older, unlined landfills. The model also illustrates cleanup of contaminated groundwater.

## EnviroScape® Waste Management

**How does a landfill work? How can we manage our waste better?** This model provides an exciting way to learn how landfills are designed to manage our waste and protect the environment. It demonstrates a functioning modern landfill operation, including recycling, leachate collection, composting, and groundwater monitoring, then compares it with the trash dumps of the past.
